

Isotope measurements of volatiles from the polar region of Moon.

Ko Hashizume (Osaka Univ; kohash@ess.sci.osaka-u.ac.jp)

- How much of volatiles we **expect** on Moon?

Needs of information regarding “**Climatology on Moon**”:

Sources

Volatile sources, fluxes, and their change over time.

Behavior

Chemical reactions (Volatile Elements → Volatile Compounds)

Migration (Entire surface of Moon → Polar region)

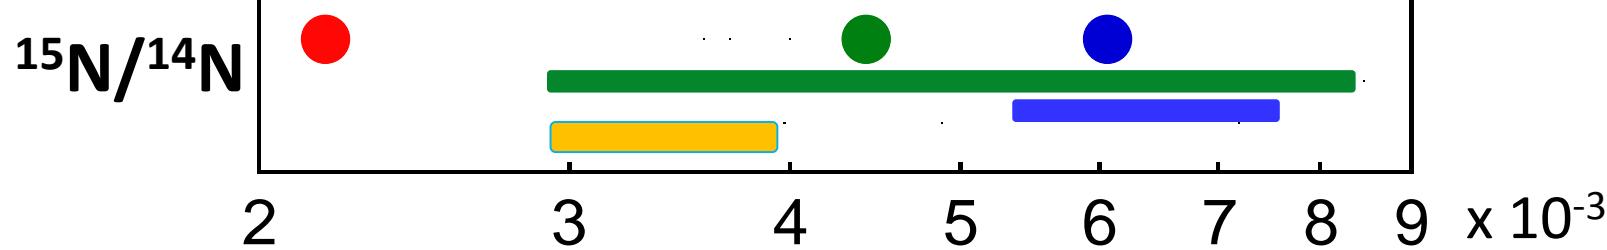

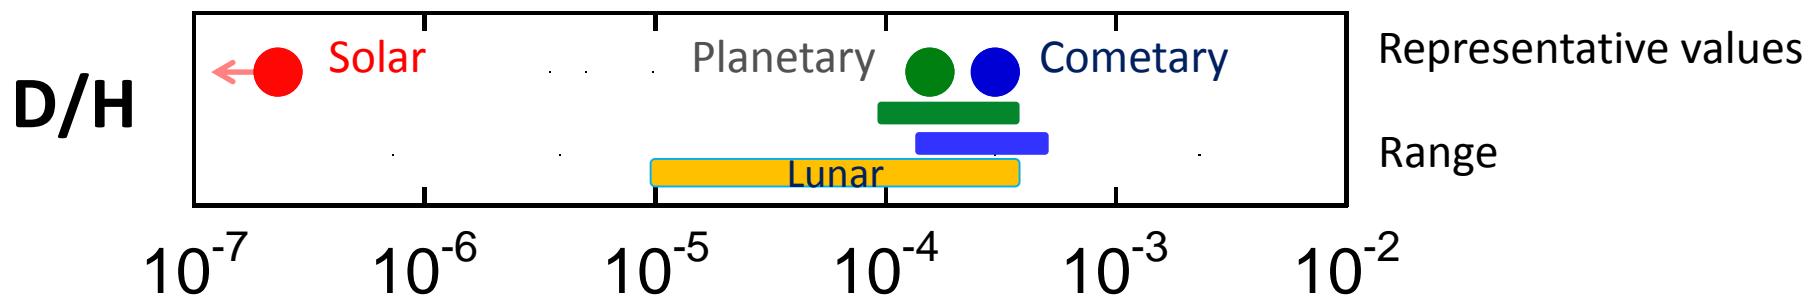

Trapping (Permanent shadow? In the regolith?)

Dissipation (Process, and timescale)

Isotopes

Water $(\text{H}, \text{D})_2(\text{O}^{16}, \text{O}^{17}, \text{O}^{18})$

Organics $(\text{C}^{12}, \text{C}^{13})_{\text{w}}(\text{N}^{14}, \text{N}^{15})_{\text{x}}\text{O}_{\text{y}}\text{H}_{\text{z}}$

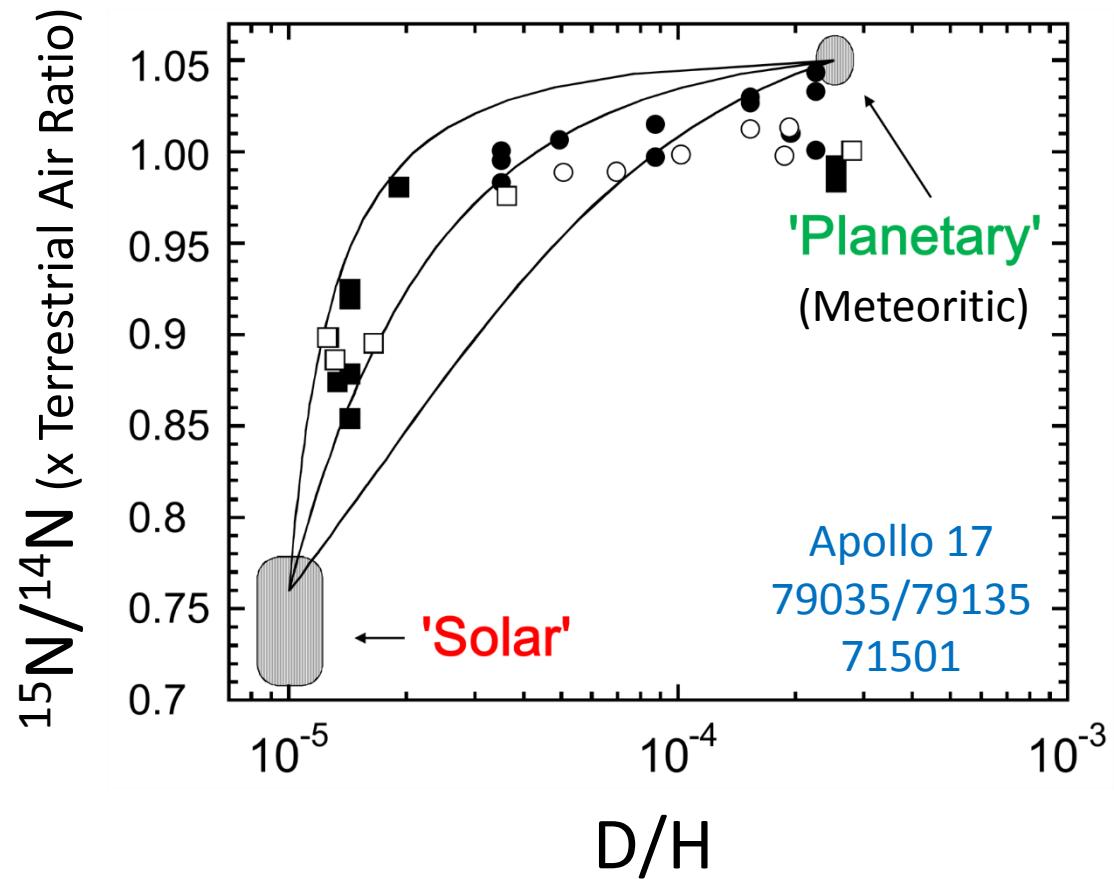

Volatiles on Moon – Past Studies

Water & Organics (compounds): Not observable in Apollo samples

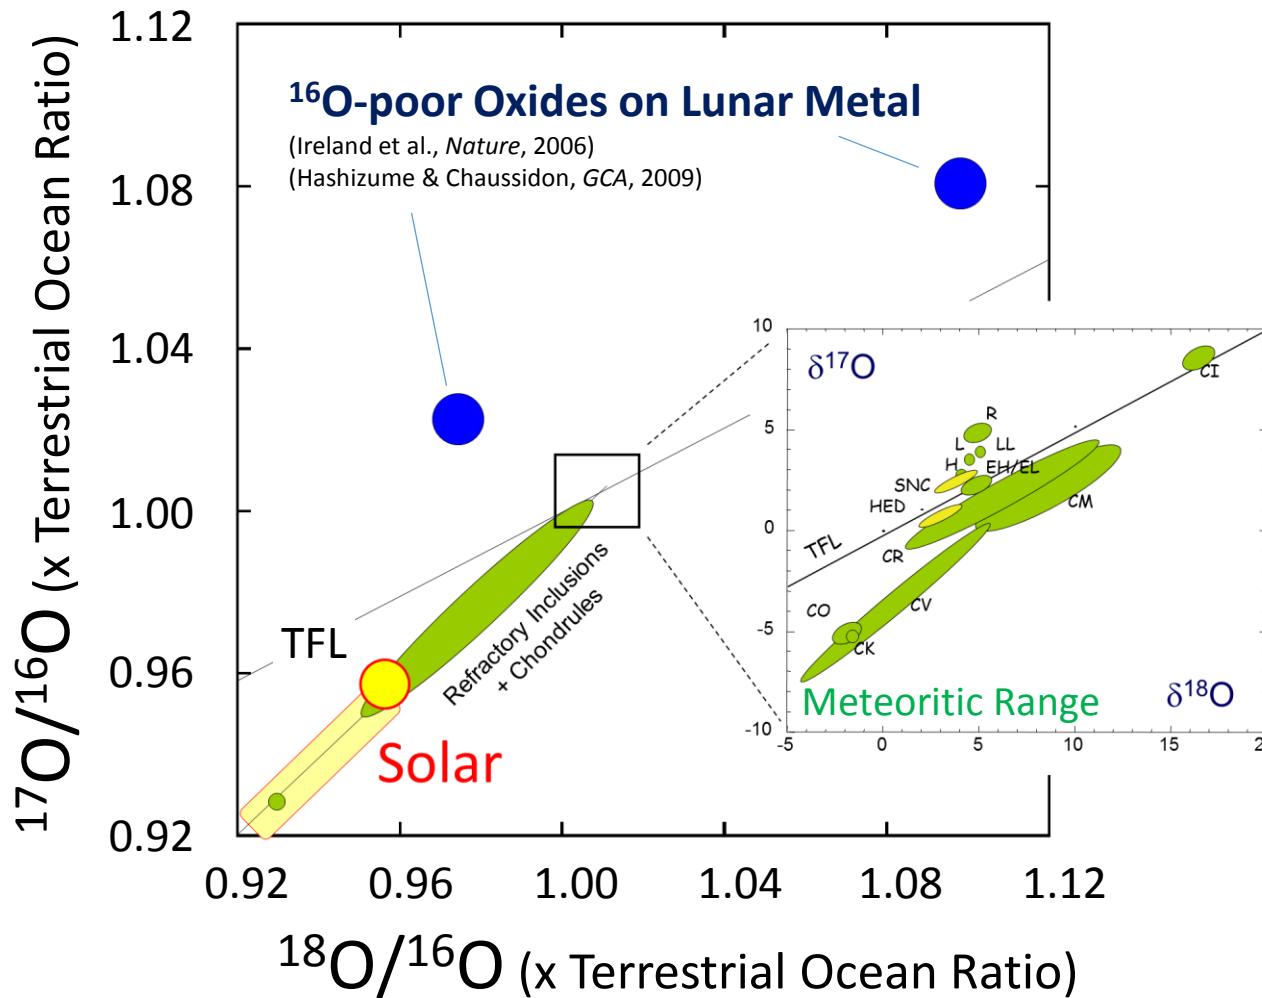

Solar Wind: The only volatile source available on Moon? **No!**

Search of non-solar volatile sources on Moon
as by-products in solar wind research

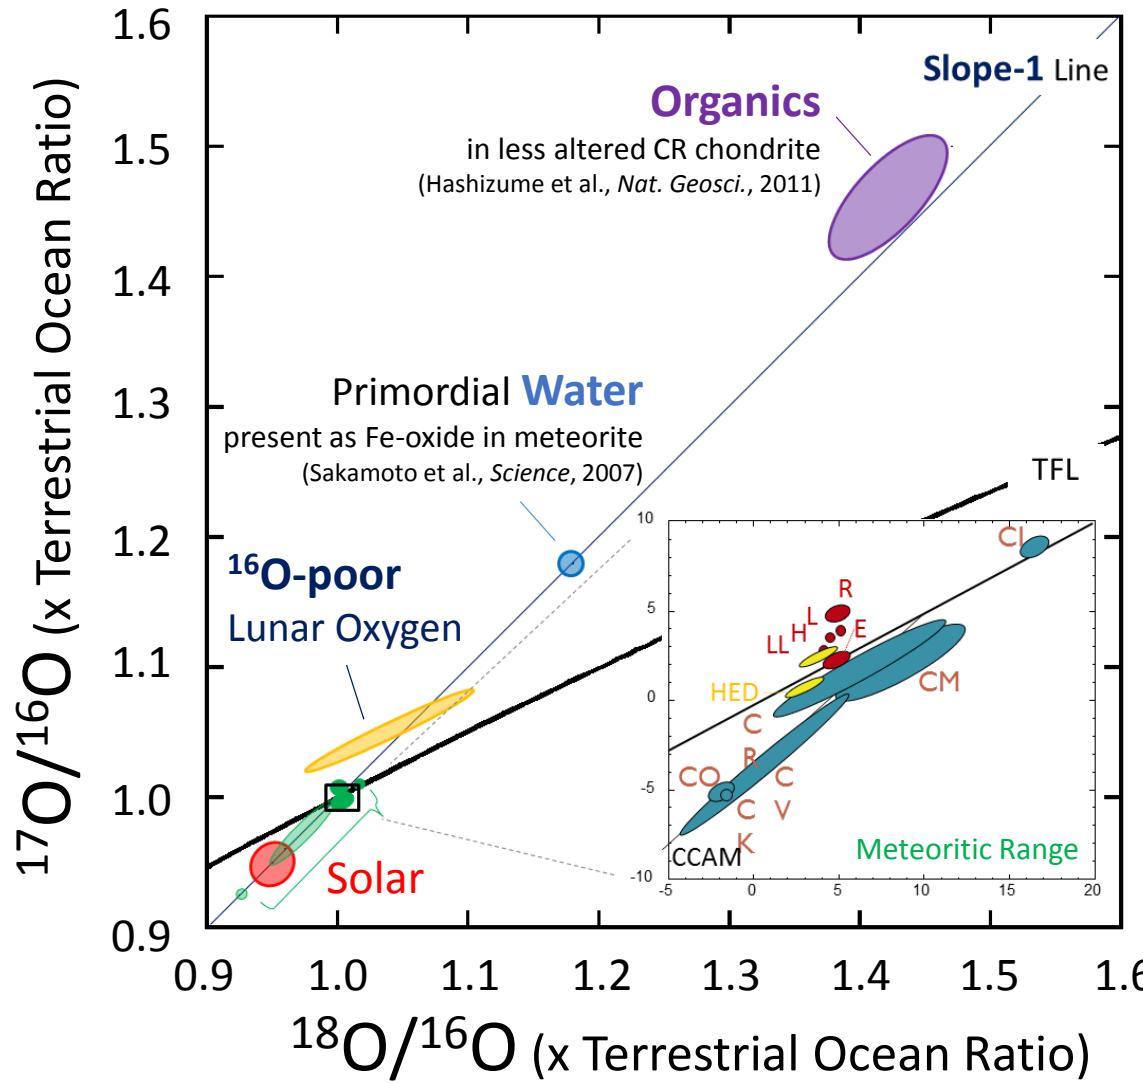

Lunar N = Solar + Micrometeorites

A strange ^{16}O -poor Oxygen found at surface of Lunar Metal Grains

^{16}O -poor Lunar Oxygen = Cometary Origin?

Organics & Water:
Analogue for
cometary composition?

Isotopes can accurately determine the origins of volatiles

We may understand:

- Origins of volatiles at Moon polar region.
- Mixing ratios of more-than-one volatile sources.
→ Fluxes of individual sources can be estimated
- Proportions of volatiles carried to the polar region.
(Insights on the migration process)

I propose **on-site measurement of volatile isotopes** at pole.

Optical Instrument:

- Absorption of Infra-Red Laser by Water Molecule.
- Space Mission-proven (ref. Sample-Analysis-on-Mars, Curiosity)
- Sensitive Water Detection, and D/H, $^{17}\text{O}/^{16}\text{O}$ & $^{18}\text{O}/^{16}\text{O}$ measurements.
